A SCORING AND INTERPRETATION PROGRAM FOR THE MMPI-2 FAKE BAD SCALE (FBS)

INSTRUCTIONS:

Enter the item responses below. Then go to the "Interpretation" worksheet for help interpreting the score.

If you already have the raw score, go directly to the Interpretation page and enter the score in the yellow box on that page.

Note: the scoring program will prorate the FBS score with the mean of the remaining items if fewer than 10 items are left blank (Fox, 2004).

Otherwise, "Too many blanks" will appear instead of a score.

FBS Total Score   [Too many blanks]   If you have calculated the total score from another program, you can enter it directly. Otherwise, this score is taken automatically from the Scoring page of this program.

Suggested Cutoff Scores

Suggested cutoff scores are 24 for males and 26 for females *(Source: Lees-Haley et al., Psychol Reports 1991;68:203-210)*
Suggested cutoff score for detecting probable TBI malingers is 21 *(Source: Ross et al., J Clin Exper Neuropsychol 2004;26:115-124)*
Suggested cutoff score for detecting definite TBI malingerers is 21 *(Source: Larrabee, The Clin Neuropsychologist 2003;17:54-68)*
Suggested cutoff score for malingering mild TBI is 20 *(Source: Greiffenstein et al., J Clin Psychol 2002;58:1591-1600)*
Suggested cutoff score for malingering severe TBI is 24 *(Source: Greiffenstein et al., J Clin Psychol 2002;58:1591-1600)*
Suggested cutoff scores for detecting malingered PTSD are 23 for males and 25 for females *(Source: Lees-Haley, J Clin Psychol 1992;48:681-689)*
Suggested cutoff scores for detecting malingered PTSD are 21 for males and 26 for females *(Source: Greiffenstein et al., The Clin Neuropsychol 2004;18:573-590)*
Suggested cutoff score for detecting malingered neuropsychological impairment is 22 *(Source: Dearth et al., Arch Clin Neuropsychol 2005;20:95-110)*
Suggested cutof score for detecting malingered severe mental illness in male inmates is 24-26 *(Source: Iverson et al., Psychol Reports 2002; 90:131-136)*

Distance from MMPI-2 Normative Sample   *Note: All standard deviation values are positive unless noted otherwise.*

If this person is male, their score is   SD from the population mean and their T-score is   .
If this person is female, their score is   SD from the population mean and their T-score is   .
(Source: Greene, in Rogers, Clinical assessment of malingering and deception, New York: Guilford, 1997)
In the MMPI-2 normative sample,   of males and   of females received a score equal to or greater than   Too many b .
*(Source: Greene, personal communication to D. Tolin, March 1, 2005)*
FBS is normally distributed in the normative sample: Males skewness = 0.52, kurtosis = 0.56; Females skewness = 0.57, kurtosis = 0.96
(Source: Greene, personal communication to D. Tolin, March 1, 2005)
FBS is normally distributed in a sample of personal injury claimants: Males skewness = .015, kurtosis = -.496, Females skewness = .087, kurtosis = .024
(Source: Lees-Haley, personal communication to D. Tolin, March 20, 2005)
FBS is normally distributed in a sample of severe TBI patients: Skewness = 0.52, kurtosis = -0.32   *(Source: Ross, personal communication to D. Tolin, April 15, 2005)*

MMPI-2 Normative Sample (N = 2600)
(Source: Greene, Personal Communication to D. Tolin, March 1, 2005)
Distance from Other Populations

This score is   SD from the mean of a sample of male medico-legal claimants.
This score is   SD from the mean of a sample of female medico-legal claimants.
This score is   SD from the mean of a sample of 258 worker's compensation applicants.
This score is   SD from the mean of a sample of 88 psychiatric patients.
This score is   SD from the mean of a sample of 45 people on criminal probation.
This score is   SD from the mean of a sample of 132 job applicants.
(Source: Fox, personal communication to D. Tolin, March 2 and October 7, 2005)

This score is   SD from the mean of a sample of 100 patients with reported cognitive impairment who were not involved in litigation.
This score is   SD from the mean of a sample of 100 patients with reported cognitive impairment who were involved in litigation.
(Source: Meyers et al., Arch Clin Neuropsychol 2002; 17:157-169)

This score is   SD from the mean of female custody litigants and   SD from the mean of male custody litigants (no alleged child abuse).
This score is   SD from the mean of female custody litigants and   SD from the mean of male custody litigants (alleged physical abuse).
This score is   SD from the mean of female custody litigants and   SD from the mean of male custody litigants (alleged sexual abuse).
This score is   SD from the mean of female personal injury litigants and   SD from the mean of male personal injury litigants.
(Source: Posthuma & Harper, Prof Psychol: Res & Pract 1998;29:437-443)
(Note: Gender-specific N's not reported. Custody litigants/no abuse N = 80; custody litigants/alleged abuse N = 108; personal injury N = 95)

This score is   SD from the mean of 492 personal injury litigants claiming impairment from physical or psychological trauma.
(Source: Lees-Haley, J Clin Psychol 1997; 53:745-755)

This score is   SD from the mean of a sample of 120 psychiatric clinic patients who were involved in litigation.
This score is   SD from the mean of a sample of 208 psychiatric clinic patients who were not involved in litigation.
This score is   SD from the mean of a sample of 43 control participants with no history of psychological disorder.
(Source: Tsushima & Tsushima, Assessment 2001; 8:205-212)

This score is   SD from the mean of a sample of 20 male medical patients being assessed for organ transplant.
This score is   SD from the mean of a sample of 25 male veterans in substance abuse treatment.
(Source: Iverson et al., Psychol Reports 2002; 90:131-136)

Distance from Probable Malingering and Non-Malingering Groups

This score is   SD from the mean of a sample of 25 personal injury litigants judged to be malingering *(based on FBS ≥ 20)*.
This score is   SD from the mean of a sample of 20 personal injury litigants judged to be credible *(based on FBS < 20)*.
This score is   SD from the mean of a sample of 16 medical outpatients instructed to simulate emotional distress from a motor vehicle accident.

This score is   SD from the mean of a sample of 15 medical outpatients instructed to simulate emotional distress from toxic exposure.
This score is   SD from the mean of a sample of 36 medical outpatients instructed to simulate emotional distress from job stress.
This score is   SD from the total mean of 67 medical outpatients instructed to simulate emotional distress.
                             (Source: Lees-Haley et al., Psychol Reports 1991;68:203-210)

This score is   SD from the mean of a sample of 59 TBI patients who are not seeking compensation.
This score is   SD from the mean of a sample of 59 patients seeking compensation for mild TBI who scored poorly on a malingering test.
                             (Source: Ross et al., J Clin Exper Neuropsychol 2004;26:115-124)

This score is   SD from the mean of males with probable PTSD and   SD from the mean of 33 females with probable PTSD.
This score is   SD from the mean of 26 males who appear to malinger PTSD and   SD from the mean of 31 females who appear to malinger PTSD.
                             (Source: Greiffenstein et al., The Clin Neuropsychol 2004;18:573-590)

This score is   SD from the mean of a sample of 64 personal injury litigants claiming non-PTSD psychological distress.
This score is   SD from the mean of a sample of 55 personal injury litigants appearing to malinger PTSD (e.g., trauma clearly did not meet DSM IIIR criterion A).
                             (Source: Lees-Haley, J Clin Psychol 1992;48:681-689)

This score is   SD from the mean of a a sample of 33 people claiming neuropsychological impairment who scored poorly on a malingering test.
                             (Source: Larrabee, Arch Clin Neuropsychol 2003;18:673-686)

This score is   SD from the mean of a sample of 24 definite neuropsychological malingerers.
This score is   SD from the mean of a sample of 17 definite neuropsychological malingerers.
This score is   SD from the mean of a sample of 54 patients with moderate/severe TBI, psychiatric disorder, or mixed neurologic diagnoses.
                             (Source: Larrabee, The Clin Neuropsychol 2003;17:410-425;
                             additional data from this study found in Larrabee, Forensic Neuropsychology: A Scientific Approach, New York: Oxford, 2005 p. 128)

This score is   SD from the mean of a sample of 23 TBI patients instructed to malinger TBI.
This score is   SD from the mean of a sample of 23 TBI patients instructed to respond honestly.
This score is   SD from the mean of a sample of 23 healthy volunteers instructed to malinger TBI.
This score is   SD from the mean of a sample of 23 healthy volunteers instructed to respond honestly.
                             (Source: Dearth et al., Arch Clin Neuropsychol 2005;20:95-110)

This score is   SD from the mean of a sample of 26 people claiming neuropsychological impairment who scored poorly on a malingering test.
This score is   SD from the mean of a sample of 29 known TBI patients.
                             (Source: Larrabee, The Clin Neuropsychol 2003;17:54-68)

This score is   SD from the mean of a sample of 25 male minimum security prison inmates.
This score is   SD from the mean of a sample of 25 male minimum security prison inmates instructed to malinger severe psychiatric problems.
                             (Source: Iverson et al., Psychol Reports 2002; 90:131-136)

This score is   SD from the mean of a sample of 42 patients with chronic psychiatric problems instructed to respond normally.
This score is   SD from the same sample of 42 psychiatric patients instructed to malinger severe psychiatric problems.
                             (Source: Rogers et al., Assessment 1995; 2:81-89)

This score is   SD from the mean of a sample of 61 patients with PTSD (validity of diagnosis not checked).
This score is   SD from the mean of a sample of 35 college students instructed to malinger PTSD who were not coached.
This score is   SD from the mean of a sample of 29 college students instructed to malinger PTSD who were coached about PTSD symptoms.
This score is   SD from the mean of a sample of 30 college students instructed to malinger PTSD who were coached about MMPI-2 validity scales.
This score is   SD from the mean of a sample of 37 college students instructed to malinger PTSD who were coached about PTSD and validity scales.
                             (Source: Bury & Bagby, Psychol Assess 2002; 14:472-484)

This score is   SD from the mean of a sample of 159 mild TBI plaintiffs with illogical symptom histories.
This score is   SD from the mean of a sample of 68 patients with documented moderate to severe TBI.
                             (Source: Greiffenstein et al., J Clin Psychol 2002; 58:1591-1600)

This score is   SD from the mean of a sample of 48 patients with major depressive disorder.
This score is   SD from the mean of a sample of 23 mental health professionals instructed to malinger major depressive disorder.
This score is   SD from the mean of a sample of 50 psychiatric patients with conditions other than major depressive disorder.
                             (Source: Bagby et al., Assessment 2000; 7:55-62)

This score is   SD from the mean of a sample of 85 undergraduates instructed to malinger PTSD.
This score is   SD from the mean of a sample of 64 outpatients with PTSD secondary to child sexual abuse.
                             (Source: Elhai et al., Assessment 2001; 8: 221-236)

Detection of Malingering vs. True Illness
Sensitivity and Specificity
In a comparison of mild TBI patients and patients seeking compensation for mild TBI who scored poorly on a malingering test,
            of probable malingerers obtained a score greater than or equal to   Too many b   , and   of TBI patients scored below   aany bi
                             (Source: Ross et al., J Clin Exper Neuropsychol 2004;26:115-124)

In a comparison of closed head injury patients and definite neuropsychological malingerers,
            of definite malingerers obtained a score greater than or equal to   Too many b   , and   of TBI patients scored below   aany bi
                             (Source: Larrabee, The Clin Neuropsychol 2003;17:54-68)

Positive and Negative Predictive Power
These analyses vary according to the presumed base rate of malingering in the population. The interpretations here allow for the assumption
of either a 25% or 50% base rate of malingering.
In a comparison of 48 probable PTSD cases and 57 probable PTSD malingerers,
Assuming a 50% base rate of malingering:
a score of   Too many blan or higher meant that the person had a   chance of being in the malingering group (females).
a score of   Too many blan or higher meant that the person had a   chance of being in the malingering group (males).

a score of	Too many blank or lower meant that the person had a	chance of being in the PTSD group (females).
a score of	Too many blank or lower meant that the person had a	chance of being in the PTSD group (males).

Assuming a 25% base rate of malingering:

a score of	Too many blank or higher meant that the person had a	chance of being in the malingering group (females).
a score of	Too many blank or higher meant that the person had a	chance of being in the malingering group (males).
a score of	Too many blank or lower meant that the person had a	chance of being in the PTSD group (females).
a score of	Too many blank or lower meant that the person had a	chance of being in the PTSD group (males).

(Source: Greiffenstein et al., The Clin Neuropsychol 2004;18:573-590)

Notes: "Below range" means that this person scored lower than did anyone in the study sample. A 0% probability of being in the malingering group might be inferred.

"Above range" means that this person scored higher than did anyone in the study sample. A 100% probability of being in the malingering group might be inferred.
