

MMPI-2 FAKE BAD SCALE (FBS)

INSTRUCTIONS:

Enter the item responses below. Then go to the "Interpretation" worksheet for help interpreting the score.

Note: This scoring form will not work correctly if there are missing items.

If you already have the raw score, go directly to the Interpretation page and enter the score in the yellow box.

FBS Total Score

29

If you have calculated the total score this score is taken automatically from

Suggested Cutoff Scores

Suggested cutoff scores are 24 for males and 26 for females (Source: Lees-Haley et al., Psychol Reports 199)

Suggested cutoff score for detecting probable TBI malingerers is 21 (Source: Ross et al., J Clin Exper Neurop)

Suggested cutoff score for detecting definite TBI malingerers is 21 (Source: Larrabee, The Clin Neuropsychol)

Suggested cutoff score for malingering mild TBI is 20 (Source: Greiffenstein et al., J Clin Psychol 2002;58:159)

Suggested cutoff score for malingering severe TBI is 24 (Source: Greiffenstein et al., J Clin Psychol 2002;58:1)

Suggested cutoff scores for detecting malingered PTSD are 23 for males and 25 for females (Source: Lees-H)

Suggested cutoff scores for detecting malingered PTSD are 21 for males and 26 for females (Source: Greiffer)

Suggested cutoff score for detecting malingered neuropsychological impairment is 22 (Source: Dearth et al., A)

Suggested cutof score for detecting malingered severe mental illness in male inmates is 24-26 (Source: Iversc

Distance from MMPI-2 Normative Sample

Note: All s

If this person is male, their score is 4.55 SD from the population mean and their T-score is

If this person is female, their score is 3.68 SD from the population mean and their T-score is

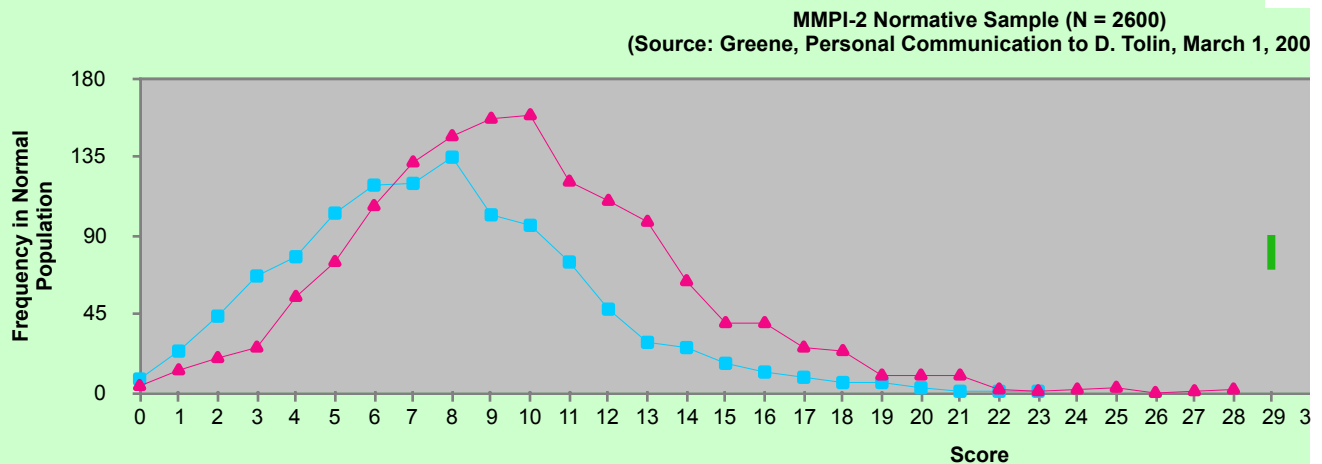

(Source: Greene, in Rogers, Clinical assessment of malingering and deception, New

In the MMPI-2 normative sample, 0.0% of males and 0.2% of females

(Source: Greene, personal communication to D. Tolin, March 1, 2005)

FBS is normally distributed in the normative sample: Males skewness = 0.52, kurtosis = 0.56; Females skewne

(Source: Greene, personal communication to D. Tolin, March 1, 2005)

Distance from Other Populations

This score is 0.91 SD from the mean of a sample of 258 worker's compensation applicants.

This score is 1.83 SD from the mean of a sample of 88 psychiatric patients.

This score is 2.82 SD from the mean of a sample of 45 people on criminal probation.

This score is 5.40 SD from the mean of a sample of 132 job applicants.
(Source: Fox, personal communication to D. Tolin, March 2, 2005)

This score is 1.83 SD from the mean of a sample of 100 patients with reported cognitive impairment w

This score is 1.00 SD from the mean of a sample of 100 patients with reported cognitive impairment w

This score is	0.68548	SD from the mean of a sample of 159 mild TBI plaintiffs with illogical symptom histor
This score is	1.76	SD from the mean of a sample of 68 patients with documented moderate to severe T (Source: <i>Greiffenstein et al., J Clin Psychol 2002; 58:1591-1600</i>)
This score is	1.27272	SD from the mean of a sample of 48 patients with major depressive disorder.
This score is	0.13636	SD from the mean of a sample of 23 mental health professionals instructed to maling
This score is	1.59090	SD from the mean of a sample of 50 psychiatric patients with conditions other than r (Source: <i>Bagby et al., Assessment 2000; 7:55-62</i>)

Detection of Malingering vs. True Illness

Sensitivity and Specificity

In a comparison of mild TBI patients and patients seeking compensation for mild TBI who scored poorly on a r
50.8% of probable malingerers obtained a score greater than or equal to 29
(Source: *Ross et al., J Clin Exper Neuropsychol 2004;26:115-124*)

In a comparison of closed head injury patients and definite neuropsychological malingerers,
42.3% of definite malingerers obtained a score greater than or equal to 29
(Source: *Larrabee, The Clin Neuropsychol 2003;17:54-68*)

Positive and Negative Predictive Power

These analyses vary according to the presumed base rate of malingering in the population. The interpretation of either a 25% or 50% base rate of malingering.

In a comparison of 48 probable PTSD cases and 57 probable PTSD malingerers,
a score of 29 or higher meant that the person had a 92% chance of

a score of	29	or higher meant that the person had a	71%	chance of
a score of	29	or higher meant that the person had a	87%	chance of
a score of	29	or higher meant that the person had a	69%	chance of
a score of	29	or lower meant that the person had a	64%	chance of
a score of	29	or lower meant that the person had a	87%	chance of
a score of	29	or lower meant that the person had a	63%	chance of
a score of	29	or lower meant that the person had a	84%	chance of

(Source: Greiffenstein et al., *The Clin Neuropsychol* 2004;18:573-590)

*Notes: "Below range" means that this person scored lower than did anyone in the study sample. A 0% probability
 "Above range" means that this person scored higher than did anyone in the study sample. A 100% probability

SD from the mean of male custody litigants (no alleged child abuse).
SD from the mean of male custody litigants (alleged physical abuse).
SD from the mean of male custody litigants (alleged sexual abuse).
SD from the mean of male personal injury litigants.

SD from the mean of 33 females with probable PTSD.
SD from the mean of 31 females who appear to malingering PTSD.

, and 100.0% of TBI patients scored below 29 .

, and 96.6% of TBI patients scored below 29 .
